Low Levels of Hepatitis B Knowledge and Practice Among Perinatal Nurses

Chrissy Cheung, MPH
Perinatal Research Coordinator
Asian Liver Center at Stanford University
Hepatitis B Prevention Coordinator
Santa Clara County Public Health Department
Learning Objectives

1. To identify and understand the risks and risk factors of chronic hepatitis B infection and the importance of newborn immunization

2. To understand current levels of hepatitis B knowledge and preventive practices among perinatal nurses in Santa Clara County, California

3. To identify ways to partner with public health departments and hospitals in addressing gaps in knowledge and prevention
Hepatitis B is One of the Most Neglected Global Epidemics

- **240** million worldwide have chronic (life-long) HBV infection (*compare with 33 million living with HIV*)\(^1,2\)

- Without appropriate treatment or monitoring, **1 in 4** person with chronic HBV will die of liver cancer, cirrhosis or liver failure

- HBV takes a **700,000 to 1 million** lives a year\(^1,2\)

- **60-80%** of primary liver cancer (Hepatocellular carcinoma)

---

1 CDC. Available at: [www.cdc.gov/ncidod/diseases/hepatitis/b/faqb.htm](http://www.cdc.gov/ncidod/diseases/hepatitis/b/faqb.htm)
2 WHO. Available at: [www.who.int/csr/disease/hepatitis/en/](http://www.who.int/csr/disease/hepatitis/en/)
Chronic HBV Infection: A Silent Killer Among Asians and Pacific Islanders

- **1 in 10** foreign born Asian and Pacific Islanders (API) are chronically infected (compared with **1 in 1000** Caucasians)
- **2 out of 3** API tested positive are not aware they are infected
- Most people with chronic HBV infection have no symptoms, even early liver cancer often has no symptoms

**75%** of those who die of chronic HBV acquired their infection before age 10, **40%** acquired it at birth

*Perinatal prevention is key!*
GAP: Poor case identification

Identified and Expected Births to HBsAg-Positive Mothers, US, 1993-2003

Source: Centers for Disease Control and Prevention
GAP: Poor ACIP compliance

• Of infants born to **HBsAg+ women**, 38% did not receive HBV birth dose/HBIG in 12 hours
• Of infants born to **women of unknown status**, 48% not vaccinated at 12 hours and 20% still not vaccinated by discharge
• Of infants born to **HBsAg- women**, only 69% vaccinated by discharge

• **U.S. National birth dose immunization rate:**
  • D1 63%, D3 71% (CDC 2012)

GAP: Poor ACIP compliance

- No lab copy of test results
  - 87.2% cases missing lab copy
- Clinicians misinterpret and mis-transcribe test results
  - Of 27 women with documented positive HBsAg test result, in 15 cases the maternal test result was different or missing in the infant chart – medical error rate of >50%

CONSEQUENCES

• 800-1,600 infants are likely to be infected each year compared with fewer than 30 infants born to HIV positive women

• HBsAg+ women not identified for case management

• HBsAg+ pregnant women are not referred to appropriate medical management

• Identification, screening, and management of household contacts still lacking

To assess current levels of knowledge and clinical practice related to hepatitis B among perinatal nurses in a U.S. population at high risk of chronic hepatitis B

... To improve population-wide perinatal hepatitis B prevention
METHODS

• Cross-sectional study
• IRB approved
• Location: Santa Clara County
• Self-administered 18 question multiple choice surveys:
  – Current HBV practices
  – Current HBV knowledge
  – Post-seminar HBV practices (future)
  – Post-seminar HBV knowledge
• Exclusions:
  – Nurses who omitted more than ½ the questions in a given survey section
METHODS

RN education provided at hospital-wide nurse competency trainings or skills days, during weekly staff meetings and at seminars in between nursing shifts . . .

81 sessions on 31 separate days
NURSE DEMOGRAPHICS

N

- N=518

Gender

- Female= 99%

Experience

- Range= 20-69 years
- Mean= 44 years
- Median= 44 years

Ethnicity

- Asian= 42%
- Non-Hispanic White= 37%
## RESULTS: Practice Survey

*N=481, questions only asked pre-seminar*

<table>
<thead>
<tr>
<th>Question</th>
<th>Pre-seminar</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Have you ever had a pregnant patient who tested positive for HBsAg?</td>
<td>80%</td>
</tr>
<tr>
<td>2. Do you routinely <strong>provide education information</strong> about hepatitis B to HBsAg+ pregnant patients?</td>
<td>51%</td>
</tr>
<tr>
<td>3. Do you routinely advise HBsAg+ pregnant women to <strong>consult with a liver specialist or internist</strong>?</td>
<td>17%</td>
</tr>
<tr>
<td>4. Do you routinely inform HBsAg+ pregnant women that it is important to receive a <strong>birth dose within 12 hours</strong>?</td>
<td>78%</td>

</table>

*All changes in knowledge statistically significant, P<0.0001 vs. pre-seminar knowledge*
RESULTS: Post-Seminar

• Nearly all nurses reported that they would educate all foreign-born Asian and Pacific Islander patients about chronic hepatitis B

• All nurses reported that they would provide hepatitis B educational materials to their patients

• All nurses reported that the session was useful
RESULTS

• Pre-seminar knowledge was not associated with pre-existing preventive clinical practices

• The change in knowledge did not significantly vary between nurses who reported following and not following hepatitis B preventive practices.
DISCUSSION

Low existing level of hepatitis B related knowledge and clinical practice among perinatal nurses

WHY?
QUALITATIVE STUDY

Education and Counseling of Pregnant Patients with Chronic Hepatitis B: Perspectives from Obstetricians and Perinatal Nurses in Santa Clara County, California

- To better understand the barriers to hepatitis B prevention
- To investigate reasons for poor hepatitis B knowledge and delivery of education to HBsAg-positive pregnant women in Santa Clara County, California.

QUALITATIVE STUDY

- IRB approved
- Location: Santa Clara County, California
- Semi-structured, face-to-face interviews with 33 obstetricians and perinatal nurses
- Interviews transcribed. Data was coded, organized and developed into themes
## QUALITATIVE STUDY: THEMES

<table>
<thead>
<tr>
<th>Lack of Self Efficacy</th>
<th>Patient Cues</th>
<th>Environmental Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Lack of training and preparation in medical and nursing school</td>
<td>• Patient apathy, stigma, and preferential concern for short-term health issues</td>
<td>• Lack of time and resources</td>
</tr>
<tr>
<td>• Poor knowledge of hepatitis B</td>
<td>• Doubt about efficacy of patient education</td>
<td>• Failures in the system</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Importance of accurate educational resources</td>
</tr>
</tbody>
</table>
DISCUSSION

• Low existing level of hepatitis B related knowledge and clinical practice among perinatal nurses
• Effective education and training efforts are needed
• In-service seminars can successfully increase nurse knowledge about hepatitis B
• Institutional changes within the government, hospitals, and insurance companies may serve to improve hepatitis B prevention

Partners and coalition-building within the community is key!
EDUCATIONAL MATERIALS

- Diagnosis Packets for obstetricians
- Hospital Discharge Packets for new moms
- Educational brochures

SCREENING REQUIREMENTS

Does the jurisdiction require screening of pregnant women for hepatitis B infection or hepatitis B surface antigen (HBsAg)?
Yes - Mich. Comp. Laws § 333.5123

Does the jurisdiction specifically require reporting of positive HBsAg status in pregnant women?
This website was developed as a resource for moms, health care providers, and public health officials to reduce perinatal hepatitis B transmission and the associated health consequences.
